

Lab 9

Introduction To PHP

Learning Outcomes

At the end of this lab exercise, students should be able to:

1. Apply basic PHP syntax and embed PHP code within HTML webpages.
2. Use the PHP `include()` function to create reusable webpage components such as header and footer files.
3. Retrieve and process user input using the PHP `$_POST[]` method.
4. Develop dynamic webpages that display user-submitted data in structured table format.
5. Use arrays and `foreach` statements to process checkbox input data.
6. Perform arithmetic calculations and display formatted output using PHP functions such as `number_format()`.
7. Design a simple dynamic web application using HTML, CSS, and PHP integration.
8. Organize web application files properly within the XAMPP htdocs directory and test the application using `localhost`.

Instruction

Please download the provided Lab 9 source code folder from ULearn and place the folder inside your htdocs directory in XAMPP before starting the lab exercise. The source files include the login page, registration form, header and footer template files, CSS styling, text data file, and sample PHP forms that will be used throughout Lab 9 and Lab 10. Students are required to use these files as the base system and complete the remaining tasks and exercises according to the lab instructions provided.

Task 1: Complete the head.php File

The file `head.php` provided contains the basic header structure and navigation menu for the system. However, the PHP section inside the `<header>` is still incomplete.

Students are required to complete the PHP code section to display the following information dynamically at the top of the webpage:

- Current Date
- Subject Code
- Subject Name
- Student Name
- Matric Number

Instructions

1. Open the `head.php` file.
2. Locate the following incomplete PHP section:

```
<?php
/*output date, subject code, subject name, your name and matric number
*/
?>
```

3. Replace the section with appropriate PHP code to display the required information.
4. Ensure the information is displayed neatly inside the header section.
5. Use the PHP `Date()` function to display the current date automatically.

Example Output

Additional Notes

1. Students may use HTML tags such as `<h3>`, `<p>`, or `<div>` to improve the layout.
2. The information should appear before the navigation menu.
3. The completed head.php file will be reused throughout Lab 9 and Lab 10 using the PHP `include()` function.

footer.php

The footer.php file contains the footer section of the website. It is used to display:

- copyright information
- email address
- current year automatically using PHP `Date("Y")`

This helps ensure that all pages have a consistent footer design and reduces duplicate code.

To use this file in other pages, students should include:

```
<?php include("footer.php"); ?>
```

Example Output

Purpose of Using Header and Footer Files

Using separate header and footer files is a common web development practice because it:

- improves code organization
- reduces repetitive coding
- makes maintenance easier
- ensures consistent layout across all webpages
- simplifies future updates to navigation or footer content

Students are encouraged to reuse these files throughout the lab exercise and modify them according to the system requirements.

Task 2: Create `welcome.php` Page Using Header and Footer Files

Students are required to create a new PHP file named `welcome.php` based on the sample provided. This page will demonstrate how to reuse the `head.php` and `footer.php` files using the PHP `include()` function.

Instructions

1. Create a new file named: `welcome.php`
2. Inside the file, create the basic HTML structure.
3. Use the following PHP `include()` statements to insert:
 - the header section from `head.php`
 - the footer section from `footer.php`
4. Display:
 - a welcome message
 - the image `welcome.jpg`
5. Use PHP echo statements to display the content.

Example Output

Task 3: Complete `p_form.php` to Display User Input Data

In the `head.php` navigation menu , the **FORM** link connects to `UserForm.php`, which has already been provided to students . Students are required to complete the processing page named:

`p_form.php`

This file will process all data submitted from `UserForm.php` and display the output neatly in table format as shown in the sample file provided.

Example Output

The screenshot shows a web application interface. At the top right, the date "Monday 25/05/2026" is displayed. The main heading is "DITM2123: WEB PROGRAMMING". Below this, there are labels for "Name: Your Name" and "Matric Number: Your Matric Number". A navigation bar contains links: [HOME](#), [FORM](#), [ORDER FORM](#), [READ FILE](#), [WRITE FILE](#), [VIEW MEMBER](#), [VIEW PROFILE](#), [UPDATE PROFILE](#), and [LOGOUT](#). The main content area has a yellow background and a "WELCOME Norazlin Mohammed" message. A table displays user data:

First Name	Norazlin
Last Name	Mohammed
Address	Melaka
Email	norazlin@utem.edu.my
Phone Number	0196625588
Gender	Female
Favourite Site	Google Facebook Utem
Comment	good

At the bottom right, the copyright notice "© norazlin@utem.edu.my 2020 - 2026" is visible.

Instructions

1. Open the provided `UserForm.php` file.
2. Study all form input names carefully such as:
 - first name
 - last name
 - address
 - email
 - phone number
 - gender
 - favourite site
 - comment
3. Create or complete the `p_form.php` file.
4. Retrieve all submitted form data using the PHP `$_POST[]` method.
5. Display all submitted information inside an HTML table.
6. Include:
 - `head.php`
 - `footer.php`using the PHP `include()` function.

7. Display a welcome message using the user's first name and last name.
8. Save the file and test it by opening:

`http://localhost/yourfolder/UserForm.php`

Required Features

The output page must:

- display all user input data
- use PHP variables
- use `$_POST[]`
- display checkbox values using `foreach`
- include header and footer template files
- display output neatly using a table

Complete Code for p_form.php

```
<!DOCTYPE html>
<html>
<head>
    <title>Display User Form Data</title>
    <link rel="stylesheet" type="text/css" href="format.css">
</head>

<body>

<?php
include("head.php");

// Retrieve data from UserForm.php using $_POST
$fName  = $_POST['fname'];
$lName  = $_POST['lname'];
$address = $_POST['address'];
$email  = $_POST['email'];
$phone  = $_POST['phone'];
$gender = $_POST['gender'];
$site   = $_POST['site'];
$comment = $_POST['comment'];

// Display welcome message
echo "<center><h3>WELCOME " . $fName . " " . $lName . "</h3></center>";
?>

<section>
<div class="container">
<div class="login-container">

<table border="1">
    <tr>
        <th colspan="2">USER INFORMATION</th>
    </tr>

    <tr>
        <td>First Name</td>
        <td><?php echo $fName; ?></td>
    </tr>
```

```

        <tr>
            <td>Last Name</td>
            <td><?php echo $lname; ?></td>
        </tr>

        <tr>
            <td>Address</td>
            <td><?php echo $address; ?></td>
        </tr>

        <tr>
            <td>Email</td>
            <td><?php echo $email; ?></td>
        </tr>

        <tr>
            <td>Phone Number</td>
            <td><?php echo $phone; ?></td>
        </tr>

        <tr>
            <td>Gender</td>
            <td><?php echo $gender; ?></td>
        </tr>

        <tr>
            <td>Favourite Site</td>
            <td>
                <?php
                    foreach ($site as $value) {
                        echo $value . "<br>";
                    }
                ?>
            </td>
        </tr>

        <tr>
            <td>Comment</td>
            <td><?php echo $comment; ?></td>
        </tr>
    </table>

</div>
</div>
</section>

<?php
include("footer.php");
?>

</body>
</html>

```

Task 4: Complete `order.php` to Process Food Order Form

In the `head.php` navigation menu, the **ORDER FORM** link connects to `calculationForm.php`, which has already been provided to students . Students are required to complete the processing file named:

`order.php`

This file will process all food order information submitted from `calculationForm.php` and calculate the total payment for each menu item and the overall payment amount.

Example Output

Monday 25/05/2026

DITM2123: WEB PROGRAMMING
Name: Your Name
Matric Number: Your Matric Number
[HOME](#) | [FORM](#) | [ORDER FORM](#) | [READ FILE](#) | [WRITE FILE](#) | [VIEW MEMBER](#) | [VIEW PROFILE](#) | [UPDATE PROFILE](#) | [LOGOUT](#)

Thank You **Norazlin Mohammed** For Ordering Food With Us

Name:	Norazlin Mohammed		
Email:	norazlin@utem.edu.my		
Phone:	019558222		
Address:	Melaka		
ITEM:	PRICE (RM)	QUANTITI	TOTAL PRICE (RM)
Nasi Ayam:	6.50	5	32.50
Nasi Ambeng:	7.80	2	15.60
Nasi Tomato:	7.80	1	7.80
JUMLAH BAYARAN	55.90		

© norazlin@utem.edu.my 2020 - 2026

Instructions to Students

1. Open the provided `calculationForm.php` file.
2. Study all form input names carefully such as:

- customer name
- email
- phone number
- address
- item price
- quantity ordered

3. Create or complete the file:

`order.php`

4. Retrieve all submitted form data using the PHP `$_POST[]` method.
5. Calculate:

- total price for each menu item
- overall total payment

6. Display all customer information and order details inside a table.
7. Include:

- `head.php`
- `footer.php`

using the PHP `include()` function.

8. Use the PHP `number_format()` function to display currency values in 2 decimal places.

Complete Code for order.php

```
<!DOCTYPE html>
<html>
<head>
    <title>Food Order Output</title>
    <link rel="stylesheet" type="text/css" href="format.css">
</head>

<body>

<?php
include("head.php");

// Retrieve customer information
$name    = $_POST['name'];
$email   = $_POST['email'];
$phone   = $_POST['phone'];
$address = $_POST['address'];

// Retrieve item price and quantity
$p_nAyam = $_POST['p_nAyam'];
$q_nAyam = $_POST['q_nAyam'];

$p_nAmbeng = $_POST['p_nAmbeng'];
$q_nAmbeng = $_POST['q_nAmbeng'];

$p_nTomato = $_POST['p_nTomato'];
$q_nTomato = $_POST['q_nTomato'];

// Calculate total for each item
$t_nAyam = number_format(($p_nAyam * $q_nAyam), 2);
$t_nAmbeng = number_format(($p_nAmbeng * $q_nAmbeng), 2);
$t_nTomato = number_format(($p_nTomato * $q_nTomato), 2);

// Calculate overall payment
$total = number_format(($t_nAyam + $t_nAmbeng + $t_nTomato), 2);
?>

<center>

<h3>
Thank You
<?php echo "<font color='red'>" . $name . "</font>"; ?>
For Ordering Food With Us
</h3>

<section>
<div class="container">
<div class="login-container">

<table border="1">

<tr>
    <th>Name</th>
    <td colspan="3"><?php echo $name; ?></td>
</tr>
```

```

<tr>
    <th>Email</th>
    <td colspan="3"><?php echo $email; ?></td>
</tr>

<tr>

</html>
```

End of Lab

Students are required to:

- ensure all files are saved correctly inside the project folder,
- test all webpages and form functions using localhost,
- verify that all links and PHP include files work properly,
- and make sure the output is displayed correctly without errors.

Before submission:

- organize all source files properly,
- include all required screenshots as proof of completion,
- and compress the project folder into a .zip file for submission to ULearn.

Students are encouraged to explore additional improvements such as enhancing the webpage design, adding validation, or improving the user interface for better user experience.
